Bycatch of protected species - Hector's and Māui's dolphin entanglements (1921-2008)

Title	Bycatch of protected species - Hector's and Māui's dolphin entanglements (1921-2008)
Publisher	New Zealand's Environment Reporting Series: The Ministry for the Environment and Statistics New Zealand
Description	The Hector's and Māui's dolphins are subspecies of the small dolphin <i>Cephalorhynchus hectori</i> . They are endemic to New Zealand (not found anywhere else). The Hector's dolphin is classified as nationally endangered, while the Māui's dolphin is nationally critical. Reporting incidental dolphin deaths from fishing helps us understand the pressures our protected marine species face from fishing. This dataset relates to the "Bycatch of protected species: Hector's and Māui's dolphin" measure on the Environmental Indicators, Te taiao Aotearoa website.
