Estimated annual Salvin's albatross captures in trawl and longline fisheries by fishery type (2003–13)

Title	Estimated annual Salvin's albatross captures in trawl and longline fisheries by fishery type (2003–13)
Publisher	New Zealand's Environment Reporting Series: The Ministry for the Environment and Statistics New Zealand
Description	Along with sea lions, fur seals, and dolphins, seabirds are the protected species most directly affected by fisheries in New Zealand waters. Estimating seabird deaths from bycatch is one way of assessing the pressure some seabird species face from current fishing practices. This dataset relates to the "Bycatch of protected species: seabirds" measure on the Environmental Indicators, Te taiao Aotearoa website.
