Notified cases of campylobacteriosis and cryptosporidiosis (1997–2013)

Title	Notified cases of campylobacteriosis and cryptosporidiosis (1997–2013)
Publisher	New Zealand's Environment Reporting Series: The Ministry for the Environment and Statistics New Zealand
Description	Bacteria and parasites like campylobacter, salmonella, and cryptosporidium can contaminate our food and water, leading to serious illness. Campylobacter, salmonella, and cryptosporidium are influenced by temperature and other climate variables, and incidence rates may increase as climate change causes temperatures to rise. Monitoring the incidence rates of illnesses can help us assess the health risks related to climate change and better prepare for disease outbreaks. This dataset relates to the "Food and water-borne diseases" measure on the Environmental Indicators, Te taiao Aotearoa website.
