Conservation status of native freshwater fish and invertebrates, 2013

Title
Conservation status of native freshwater fish and invertebrates, 2013

Publisher
New Zealand's Environment Reporting Series: The Ministry for the Environment and StatsNZ

Description
New Zealand has a diverse range of freshwater species. Many of these species are endemic to (only occur in, or only breed in) New Zealand. Freshwater fish and invertebrates are indicator species for the state of our freshwater environment. A decreasing population can indicate that the ecosystem is degrading. This measure reports on the conservation status of New Zealand's indigenous freshwater fish and invertebrate species, including the number of species that have had a genuine change in conservation status between two monitoring periods (2009–13 and 2005–13). A change in a species' conservation status reflects a change in its risk of extinction.
